

Endpoint Security for ATMs

Comprehensive protection for your ATM fleet

Criminal acts against ATMs have always been a top concern for financial institutions. With increasingly sophisticated security threats targeting your assets and your customers' personal data, securing your ATM software becomes as important as securing the machine itself.

Cummins Allison's ATMs Endpoint Security is a managed service that helps to ensure your ATM software is protected from malware, zero-day attacks and cybercriminals, real-time.

Identify and contain infections for data security

For maximum data protection, Endpoint Security provides security for all information on all endpoint drives, including user data, nonessential operating system files, temporary and erased files. Authentication verifies user identity before the operating system loads, while encryption helps to prevent data theft. Removable storage media such as USB flash drives, backup hard drives, CDs and DVDs are also protected.

Threat prevention: malware never sleeps

Endpoint Security provides malware and ransomware protection across your ATM network. It delivers broad defenses against targeted attacks, as well as unknown threats, before they can penetrate the network. Only approved software applications are allowed to run. Unrecognized software is prevented from executing.

Infections are automatically and fully quarantined and files that were encrypted prior to containment are restored.

Rapid detection, immediate response

A comprehensive ATM security program must rapidly detect a security problem and immediately issue the correct response. Our ATM Endpoint Security responds automatically based upon predefined security policies.

Additionally, Cummins Allison can generate reports for security events as needed for auditing and compliance.
